

Task 5 - Raspberry Pi Deployment

In Task 4, you were asked to completely rewrite your code into a deployment-ready GitHub branch called *RaspberryDeployment*. **Task 5 will deal with actually deploying your newly written package to the Raspberry Pi and, following that, presenting your project as a whole.**

Task 5 will be the final task of Project Eagle.

Task 5.1 - Deploying your Package

To deploy your package to the Raspberry Pi, we will use SSH. The actual deployment will take place in the form of the GitHub command, `git clone`, which will clone your branch onto the Raspberry Pi. On your Raspberry Pi, you should regularly pull the latest code before running it, but you should **never** push code to your deployment branch.

To complete this task, you should learn how SSH works and be able to control your Raspberry Pi without a directly connected screen.

If you have done everything correctly, the code should run without issues on the new system as a compact operating unit.

Task 5.2 - Presenting your Project

To showcase your progress and work, we thought it would be a good idea to include a project presentation as part of this task. Our suggestion is to create a short demo video presenting your project's purpose and operation. For this, **all team members should be present** and demonstrate the complete process, from pulling the newest deployment branch, showing any command-line features your project provides, and finally displaying the clean output of the determined offsets in your SSH command window.

The video does not need to be especially long; we believe that 5 minutes should be sufficient.

The video should be accompanied by a technical explanation of the project's functionality and special features. It is good practice to mention the documentation as a reference for further information.

It should also briefly discuss the background and intended use of the project, as well as how you specifically implemented features to make it more practical and effective within that context.

Overall, the video should take the form of a presentation, introduction, trailer, or demo of your project.

Think of it as presenting your project to investors.

Task 5.3 - Preparing to Present (for later)

As a final part and end of the project, we also want to give you the opportunity to present all your progress, findings, and features to your fellow comrades. We will set a date for a meeting where ALL participants, us, and probably Mathias Lehmann will take part and get the time to discuss any special implementations you made.

This meeting will take place after the deadline for Tasks 5.1 and 5.2, around mid-July.

Here you will all get the time you need to describe your project in front of the group and be given the opportunity to inquire either other groups or us. You will also be able to voice any feedback or concerns regarding the project.

We hope this task, and its smaller size, compensates for the large scope of Task 4 and therefore serves as a fitting end to the project this year.
